

Retirement & Investment Plan

Chris Hadley (b. 10 Nov 1983) & Abby Hadley (b. 5 Aug 1986) · Prepared 9–10 June 2026

Objective: minimise the likelihood of failing to fund £60,000/yr (real) from June 2035, accepting reduced upside

Status: **PROPOSAL — nothing executed.** Analysis prepared with Claude (finance-tracker), grounded in live account data and June 2026 market data. Not regulated financial advice.

1 • Executive summary

A guaranteed 2% real return to 2035 is not purchasable. The risk-free real rate (index-linked gilts held to maturity) is ~1.6% at the 2035 maturity. From a US Shiller CAPE of ~40, history puts the odds of equities beating 2.1%/yr real over 9 years at roughly **1-in-4**. The current ~87%-risk-asset portfolio therefore makes the retirement date a market bet.

But the actual goal — £60k/yr of spending from June 2035 — can be substantially locked, because index-linked gilt real yields (1.6–2.3% at 2035–2045 maturities, June 2026) currently sit at or above the plan's required return at exactly the right maturities. The plan:

1. **FLOOR:** buy an index-linked gilt ladder paying £60k (today's money) in every year 2035–2045. Cost: ~£498k (31% of investable assets). Extend to 2051 (~£216k more) by ~2029. Held to maturity: immune to markets, inflation-linked, backed by HM Government.
2. **GROWTH:** ~£1.0M stays in global equities. Its job shrinks to funding the years after 2046 net of two state pensions — a bar it clears in **100% of historical high-valuation starts** (and 99.6% of all 1,502 twenty-year windows since 1881).
3. **RATCHET:** every June, bank equity strength into more locked years. One-way; never re-risk.
4. **Free wins:** state-pension repair via part-time HB (Chris) and a decision needed for Abby; tax-free withdrawal sequencing worth ~£0 tax until the 2050s; crypto exit at 18% not 24%; deferred Accenture pot transfer.

The trade you accepted: in median markets the plan reaches ~£2.7M by 2035 instead of ~£3.0M; at the 90th percentile ~£4.2M instead of ~£5.1M. In exchange, the bottom quarter of outcomes — where the current portfolio delivers £37k/yr instead of £60k — is eliminated for 2035–2045 outright, and for 2046+ in every high-valuation start in 155 years of data.

2 · Current position — what this plan is built on (verified 1–9 June 2026)

Pot	Platform / scheme	Value	Current holdings	Accessible
Chris SIPP	Interactive Investor	£434,584	50:50 Vanguard LS80 / LS100 (~90% equity)	Nov 2040 (57)
Chris Accenture DC (deferred)	L&G-administered	£190,370	"Moderate risk" global fund	Nov 2040; transferable
Abby Accenture DC (active)	L&G-administered	£272,948	Same default style; + £900/mo salary sacrifice	Aug 2043 (57)
Chris ISA	Interactive Investor	~£273,037	50:50 LS80/LS100	Anytime
Abby ISA	Vanguard Investor	~£308,504	50:50 LS80/LS100	Anytime
Crypto (1 BTC + 6 ETH)	Unwrapped	~£54,000	BTC ~£46.4k, ETH ~£1.24k each (9 Jun)	Anytime (CGT)
Cash saver @4.5% / NS&I Green Bond / cash	—	~£55,000	£30k + £20k + balance	Anytime / term
Investable total		~£1.59M	~83% equity + 3% crypto + 14% other	
Excluded: house £697k (reserve of last resort), HB business stock ~£25k, Accenture shares ~£2k				

Cash-flow item (validated line-by-line, Jan–May 2026)	£/yr
Abby take-home (base £4,330/mo; Feb bonuses on top)	52,000
Hadley Bricks drawings (£500/wk)	26,000
Abby pension, payroll-direct (counts as income and savings)	10,800
Cottrell (annual, each April — confirmed recurring)	3,000
Recurring household income	91,800
Current spending run-rate (sign-aware; ex-holiday baseline ~£51k)	69,500
Savings rate (rising to ~£31.8k if spend hits £60k)	~22,300 (24%)

Key date (current law, verified vs gov.uk June 2026)	Date	Note
Retirement — Max finishes Year 11	June 2035	Chris 51½, Abby 48
Chris private pension access (57)	Nov 2040	Rise to 58 floated, never legislated
Abby private pension access (57)	Aug 2043	
Chris state pension — age 68	Nov 2051	£12,548/yr each (2026/27 full nSP); joint £25.1k
Abby state pension — age 68	Aug 2054	SPA review live; could be accelerated

3 • Assumptions — complete register

#	Assumption	Value	Basis / confidence
A1	Target spend, real, for life	£60,000/yr	Your decision (9 Jun 2026). Run-rate is £69.5k — gap must close (§7 R1)
A2	Retirement date	Jun 2035	Max finishes Y11. Decision
A3	Floor returns	1.6–2.3% real, locked	ILG yields 9 Jun 2026 (single-sourced — verify at dealing, §8 G1)
A4	Growth sleeve modelling	US monthly real returns 1871–2026	Shiller dataset. ⚠ US-only data has survivorship optimism vs a global sleeve — partially offset by sleeve's actual 48% non-US weighting
A5	Inflation protection	ILGs link RPI→CPIH (Feb 2030, confirmed)	CPIH $\approx$ your inflation $\pm$; wedge currently ~ 0
A6	Savings to 2035	£22.3k/yr	Validated actuals; assumes Abby's income persists (§7 R2)
A7	State pensions	£25.1k/yr joint from 68 (2051/2054)	Current law + complete NI records (repair plan §4.6; Abby route open)
A8	HB after 2035	Part-time, at least NI-stamp level ($\sim$ £7.1k+ profits)	Your decision (10 Jun). £20k/yr scenario = pure upside, not relied on
A9	University costs	Covered by Emmie's & Max's JISAs	Your confirmation (10 Jun); balances unverified (§8 G7)
A10	House	£697k, excluded; assumed mortgage-free	No mortgage line in spending data — unconfirmed (§8 G6)
A11	Longevity horizon	Abby to 95 (2081)	Annuity option (§5.4) covers beyond
A12	Tax system	2026/27 rules; PA frozen to 2028 then indexed; ISA/pension wrappers persist	Legislative risk §7 R3 (incl. pensions into IHT from Apr 2027 — announced)
A13	Crypto, business stock	Exit crypto $\sim$ £54k; HB stock not retirement capital	Decisions 9–10 Jun
A14	Platform access	II deals individual ILGs (phone); Vanguard cannot	Verified vs ii.co.uk; fee detail to confirm (§8 G3)

4 • Investment plan — now to 52 (June 2035)

4.1 Target structure

Sleeve	Amount	%	Instruments	Job
ILG ladder 2035–2045	£498k	31%	11 index-linked gilts, one per spending year, held to maturity	Pays £60k real/yr, years 1–11 of retirement
Ladder extension 2046–2051	~£216k	→13%	Long ILGs ~2.3% real, phased to ~2029	Years 12–17, to Chris's state pension
Growth	~£1.00M→£0.85M	63→53%	Global equity (consolidate LS80→LS100; bond sleeve redundant once floor exists)	Everything after 2046/2051; upside
Cash / MMF	~£60–80k	~5%	4.5% saver, NS&I, MMF (~3.7%)	12+ months' spending buffer
Crypto	£0	0%	Exit per 4.5	—

4.2 The ladder, rung by rung (indicative, 9 June 2026 yields)

Pays out	Indicative gilt	Real yield	Cost per £60k	Wrapper
2035	1½% IL Treasury Gilt 22 Sep 2035	1.60%	£52.0k	II ISA — bridge years, pre-pension-access. Total ~£291k ≈ the existing II ISA
2036	0¼% IL 22 Nov 2036	1.72%	£50.6k	
2037	split 2036/2039 maturities*	~1.80%	£49.3k	
2038	split 2036/2039 maturities*	~1.89%	£47.9k	
2039	0¼% IL 22 Mar 2039	~1.98%	£46.4k	
2040	0⅝% IL 22 Mar 2040	2.07%	£45.0k	II SIPP — accessible from Nov 2040 ✓. Total ~£207k
2041	0¼% IL 10 Aug 2041	~2.12%	£43.8k	
2042	0⅝% IL 22 Nov 2042	~2.17%	£42.5k	
2043	0¼% IL 22 Mar 2044 (adj.)	~2.21%	£41.4k	
2044	0¼% IL 22 Mar 2044	~2.26%	£40.2k	
2045	0⅝% IL 22 Mar 2045	2.30%	£39.0k	
Total			~£498k	

*Not every calendar year has an ILG; missing years are covered by weighting adjacent maturities. Exact gilt selection at dealing against the live DMO list; yields single-sourced (giltsyield.com, 9 Jun 2026) — cross-check with II's bond desk. Maturity-date details for ~2039–2044 rungs are indicative.

4.3 Build sequence

1. **Tranche 1 (weeks 2–6):** sell LS80 in II ISA → buy 2035–2037 rungs (~£150k). Shortest rungs first — they're the least replaceable.
2. **Tranches 2–4 (by ~Q1 2027):** complete 2038–2040 (ISA) and 2041–2045 (SIPP). Phasing over 6–9 months averages the yield entry; don't stretch longer — every month at 87% risk from CAPE 40 is the risk you've chosen not to carry.
3. **Q3–Q4 2026:** transfer Chris ACN £190k → II SIPP (after L&G written confirmations). Consolidate Vanguard ISA LS80→LS100 (stays as growth; second platform = deliberate resilience). Check Abby's L&G menu for an ILG index fund (~50% switch if available — its long duration roughly matches her 2043+ access).
4. **2026–2029:** extension rungs 2046–2051 from new savings (£11.5k/yr ISA), crypto proceeds, and ratchet sales.

4.4 The ratchet (mechanical, written down)

Each June: if growth sleeve $> 1.25 \times \text{PV}(\text{unfunded future spending net of state pensions and existing rungs})$ → sell growth, fund the next rung(s). Otherwise do nothing. Never sell ladder to buy equities. Suspend only if the next unfunded year is ≥ 12 years away and ILG real yields $< 0.5\%$.

4.5 Crypto exit (~£54k)

1. Establish base costs (gain size drives the schedule).
2. Interspousal transfer to Chris — CGT-free; he's basic-rate (18% vs Abby's 24%), with ~£24k of band headroom.
3. Use both £3k annual exemptions; split across 2026/27 + 2027/28 if gains are large.
4. Proceeds → ISA allowances (£20k each) → ladder rungs.

4.6 State-pension repair

Chris — solved by decision (10 Jun): HB continues part-time $\geq$ NI-stamp level. Profits above £7,105 (2026/27 SPT) = automatic qualifying year; below, voluntary Class 2 ~£190/yr. **Abby — open decision:** her record stops in 2035 with ~20 years to SPA. Options: (1) bring her into HB as partner/employee above the LEL (~£6.5k/yr) — stamp nearly free; (2) voluntary Class 3, £957/yr — each year buys ~£358/yr index-linked for life (payback < 3 years; annuity-equivalent value ~£7–9k). Either way: **pull both NI forecasts now** — Chris has pre-2016 contracting-out uncertainty; plan from the forecast, not the year-count.

5 · Withdrawal & tax plan — 52 to the state pensions and beyond

5.1 Year-by-year funding map

Years	Spending funded by	Tax position	Est. tax/yr
2035 – Nov 2040	ISA ladder rungs (£60k matures annually in II ISA)	ISA proceeds tax-free; gilt gains CGT-exempt anyway. HB part-time profits inside Chris's personal allowance	~£0
Nov 2040 – Aug 2043	SIPP rungs 2041–43 mature; begin Chris pension drawdown	Draw Chris pension ≈ personal allowance (£12,570) each year via UFPLS/drawdown — 25% TFC element + 0%-band income. Use-it-or-lose-it. Balance from ISA	~£0
Aug 2043 – Nov 2051	Extension rungs 2044–51 (SIPP) + both pensions open	Two personal allowances ≈ £25k/yr of pension money out at 0%; remainder from TFC entitlements and ISA. (Each 25% TFC stays under the £268,275 LSA cap)	~£0–1k
Nov 2051 – Aug 2054	Chris SP £12.5k + portfolio £47.5k	SP fills Chris's PA; his further pension draws taxed at 20%; prefer ISA/TFC for the excess	~£1–3k
Aug 2054 →	Joint SPs £25.1k + portfolio ~£35k	SPs fill both PAs; ~£35k drawn as mix of taxable pension (20%) and tax-free ISA	~£2–4k

Lifetime income-tax cost of funding £60k/yr on this sequencing is roughly **2–5p in the pound from the mid-2050s and ~zero before** — because the bridge is ISA-funded by construction and both personal allowances are deliberately filled from pensions every year from 2040. This is the quiet second benefit of holding the bridge rungs in ISAs.

5.2 Sequencing rules

- **Spend taxable-last:** ISA rungs (forced, 2035–40) → pension-within-allowance (2040+) → TFC chunks → taxable pension → ISA capital last for flexibility.
- **Crystallise gradually** (UFPLS or phased drawdown), not all at once — preserves TFC optionality and stays under tax bands. Note the recurring Budget rumours about capping tax-free cash: a reason not to leave crystallisation too late into the 2040s (watch item, not actionable now).
- **MPAA:** once Chris flexibly accesses taxable pension income (2040+), his pension contributions cap at £10k/yr — irrelevant under this plan (no contributions planned post-2035).
- **Ratchet continues in retirement:** each rung spent is one year off the runway; each good equity year adds one at the far end. Target ≥10-year funded runway at all times. After a bad equity year, don't extend — the runway IS the sequence-risk insurance.

5.3 Inheritance tax (announced change — affects this plan)

From **April 2027** (announced Oct 2024 Budget; legislation in progress), unused pension funds fall into the estate for IHT. With house + portfolio, your estate will exceed the combined NRBs. Implications: (1) the old logic of "preserve pensions, spend ISAs, pensions pass IHT-free" is dead — this plan's pension-first drawdown from 2040 is already the right shape; (2) spouse-to-spouse remains

exempt — the exposure is on second death; (3) gifting capacity opens up post-2040 once the floor is secure. Not modelled further here; revisit ~2030.

5.4 The annuity option (evaluate at Abby's 57th, Aug 2043)

At June 2026 rates a joint-life RPI-linked annuity at ~60 pays ~4.3–4.5% per £100k (estimated from published single-life RPI and joint-level ratios — get real quotes). If rates remain near this in 2043–48, annuitising ~£700–800k of pension would lock the entire post-2054 residual (~£35k/yr) plus all longevity risk, making the plan market-proof for life. It is an option, not a dependency — the ladder + state pensions may already suffice. Trigger to revisit: joint RPI-linked rate $\geq$ ~4.5% while the growth sleeve is above its ratchet threshold.

6 • Risk profile — modelled upside and downside (real data, not assumptions)

Method: every rolling 9-year monthly window in the Shiller dataset (1,634 windows, 1881–2026), simulating both portfolios month-by-month with contributions: **Current** = 87% equity / 13% bonds, £1.578M + £22.3k/yr. **Proposed** = £498k floor locked at 1.93% IRR + £1.02M equity + £60k cash + contributions locked at 2.2%. "CAPE_{≥30} starts" = the 57 windows beginning at valuations like today's (1929 and dot-com eras). All values real, today's money. Scripts in repo: `scripts/ifa-plan-simulation.mjs`, `ifa-cape-challenge.mjs`, `ifa-floor-growth-analysis.mjs`.

6.1 Portfolio at June 2035 — full distribution

Percentile	All history (n=1,634)		High-valuation starts, CAPE _{≥30} (n=57)	
	Current 87% eq	Proposed	Current 87% eq	Proposed
p5 (bad)	£1.44M	£1.68M	£1.22M	£1.43M
p10	£1.62M	£1.79M	£1.27M	£1.47M
p25	£2.29M	£2.22M	£1.56M	£1.69M
p50 (median)	£2.99M	£2.71M	£1.77M	£1.83M
p75	£3.88M	£3.33M	£2.17M	£2.12M
p90 (boom)	£5.14M	£4.18M	£2.31M	£2.22M

Reading it honestly: the headline portfolio numbers look similar — the floor's real work doesn't show in this table, because what it changes is not the 2035 *value* but what the bad outcomes *mean*:

6.2 What the downside actually looks like

Scenario (from CAPE _{≥30} starts)	Current portfolio	Proposed plan
p5 outcome	£1.22M → supports ~£37k/yr at a 3.03% withdrawal rate. Retirement delayed or spending cut ~40%	Ladder pays £60k/yr 2035–2045 in full, regardless. Growth sleeve (~£0.56M at p5) has a 10–20 yr runway to recover before it is needed
Worst single window (Oct 1999 start: –6.3%/yr for 9 yrs)	~£1.05–1.25M; plan fails badly	£60k/yr 2035–45 untouched; post-2046 partially exposed (see 6.3)
Post-2046 funding test (growth must reach £1.10M by 2046)	—	Funded in 100% of the 57 high-CAPE starts (worst: £1.12M) and 99.6% of all 1,502 twenty-year windows (worst ever: £0.98M — a ~11% shortfall, against which the £697k house and HB income stand entirely outside the plan)
Deterministic stress: 2% real flat forever	Marginal; sequence-dependent	Never depletes; portfolio ~£1.9M+ at 68, growth thereafter (modelled 9 Jun)

6.3 Modelled upside (what you forgo)

Median all-history outcome: proposed £2.71M vs current £2.99M at 2035 (−9%); boom case £4.18M vs £5.14M (−19%). In every scenario above ~p30 you'd have been richer staying put. That is the insurance premium, and it is paid *only* in the states of the world where you didn't need the insurance. Upside that survives the plan: ratchet converts strong markets into a floor reaching 2051+ years early, growth sleeve compounding into your 70s, HB profits, triple-lock drift, and the house.

6.4 Residual failure modes (what the data cannot rule out)

- **UK sovereign default on index-linked debt** — no modern precedent; would coincide with collapse of every alternative plan too.
- **Japan 1990–2010 analogue on a global portfolio** — equities at <−0.7%/yr real for 20+ years has never occurred in US data (worst −0.2%); it did occur in single-country Japan. The sleeve's ~52% US / 23% UK / 25% other spread is the mitigation; it is not a guarantee.
- **CPIH materially understating your personal inflation** — rung payouts drift below real needs; ratchet margin and spending flex absorb modest drift.
- **Legislation** — NMPA to 58, SPA acceleration, wrapper/tax changes (§7 R3).

7 • Key risks, ranked — including your recorded acceptances

#	Risk	Assessment	Mitigation / acceptance
R1	Spending stays above £60k	Live now: run-rate £69.5k. Each £5k/yr permanent ≈ £150–200k more capital	Accepted by you (10 Jun): gap is largely discretionary holiday spend; kids leaving home cuts the base. Caveat kept: kids are home for the first bridge years — track monthly
R2	Income interruption pre-2035	Abby's £52k is load-bearing for 9 more years	Accepted by you (10 Jun): redundancy would carry a good payoff; career outlook strong; upside as likely. Backstops: 12-mo cash buffer, rungs sellable at market
R3	Legislative change	NMPA 57→58 (floated); SPA 68 accelerated/69; TFC cap; ISA reform; pensions into IHT Apr 2027 (announced); triple-lock	ISA bridge already reaches 2040 with SIPP rungs behind it; consider one spare ISA rung (2041, ~£44k) as NMPA insurance; June reviews track each Budget/SPA review
R4	Growth sleeve 20-yr failure	Needs <−0.7%/yr real over 20 yrs; never in 155 yrs US data; Japan is the single-market precedent	Global spread; ratchet banks strength; house + HB outside the plan. Your view (10 Jun): upside less likely at CAPE ~40 — consistent with \$6 data
R5	Index basis (RPI→CPIH 2030)	Confirmed, no compensation; priced into yields	Wedge currently ~0; small margin in rung sizing; ratchet buffer
R6	Real yields rise after purchase	~50/50; mark-to-market only	Held-to-maturity discipline; 6–9 month phased entry
R7	Platform/custody	Low; assets ring-fenced	Two platforms by design; gilts survive platform failure; FSCS £85k/firm (shortfall), £120k cash/licence
R8	Death / illness / divorce	Plan assumes both partners, both SPs	Wills + pension beneficiary nominations (check now); consider term life on Abby to 2035 (~£500k); ISA APS exists
R9	Annuity rates fall before 2043+ window	Unknowable	Option, not dependency; ladder extension substitutes
R10	Longevity beyond 95	Modest	SPs never expire; annuity option; house

8 • Gaps in knowledge & concerns (nothing hidden)

#	Gap / concern	Why it matters
G1	ILG yields single-sourced (giltsyield.com, 9 Jun); BoE official curve not cross-checked; rung maturities ~2039–2044 indicative	±10–20bp moves ladder cost by ~£5–15k. Verify with II bond desk at dealing
G2	L&G/Accenture specifics unconfirmed: protected pension age (as at 11 Feb 2021), exit fees, safeguarded benefits, Abby's fund menu	Gates the £190k transfer and Abby's de-risking option
G3	II fee schedule post-Feb 2026 (Core £5.99/mo etc. from third-party review); phone-dealt ILG charges	Minor cost; confirm before tranche 1
G4	NI records: Chris pre-2016 contracting-out; Abby years accrued; Abby's post-2035 route undecided	Up to ~£12.5k/yr of her SP at stake; forecasts are the authority
G5	Crypto base costs unknown	Gain size sets the 1-vs-2-tax-year exit schedule
G6	Mortgage-free status assumed, not confirmed	A live mortgage inside £60k would change everything
G7	JISA balances (Emmie, Max) unverified against uni costs	Shortfall would leak into bridge-year spending
G8	Joint RPI annuity rate is my estimate (~4.3–4.5%/£100k at 60) from published singles + joint ratios	Quote properly at decision time (2043+)
G9	Simulation uses US returns for a global sleeve; pre-1926 data quality; only ~2 independent high-CAPE episodes (1929, 2000) behind the n=57 windows	The "100% funded" result is strong evidence, not proof. Treat as ~"never failed in the data", not "cannot fail"
G10	Spending data: 2025 history has known unreconciled duplicates (ignored by decision); £60k target vs £69.5k actual not yet demonstrated	The plan's biggest behavioural dependency (R1)
G11	This is analysis, not regulated advice. The ACN transfer and any annuity merit a one-off fee-only IFA check; an execution error in a £500k gilt programme is worth £500 of professional eyes	—

9 • Action checklist

#	Action	Owner	When
1	Pull both state pension forecasts + NI records (gov.uk/check-state-pension)	Chris & Abby	This month
2	Crypto base costs → transfer to Chris → plan 18%-band disposal	Chris	This month
3	L&G written confirmations (PPA / exit / safeguarded / Abby's menu), both pots	Chris & Abby	This month
4	Confirm II fees + ILG phone dealing; tranche 1: 2035–2037 rungs in II ISA (~£150k)	Chris	Weeks 2–6
5	JISA balance sanity-check; decide Abby NI route (HB role vs Class 3); confirm mortgage status	Both	Q3 2026
6	Tranches 2–4: complete bridge (ISA) + 2041–45 rungs (SIPP)	Chris	By Q1 2027
7	Transfer Chris ACN → II SIPP (after #3)	Chris	Q3–Q4 2026
8	Vanguard ISA: LS80→LS100; Abby ACN switch if ILG fund exists; wills + beneficiary nominations check	Both	Q3 2026
9	Extension rungs 2046–2051 (savings, crypto, ratchet)	Chris	2026–2029
10	Annual June review: ratchet test, spend vs £60k, legislation watch	Both	Every June

10 • Method & sources

Account data: finance-tracker database (Supabase `finance` schema), wealth snapshots 1 Jun 2026, transactions reconciled exactly to HSBC 3 Jun 2026; income validated line-by-line Jan–May 2026. **Historical modelling:** Shiller monthly US real total returns & CAPE, Jan 1871 – Jan 2026 (1,861 months) — `lib/fire/ern/data/shiller-monthly.json`; simulation scripts `scripts/ifa-plan-simulation.mjs`, `ifa-cape-challenge.mjs`, `ifa-floor-growth-analysis.mjs` (in repo, re-runnable). **Market data (as-of dates):** ILG/nominal yields — giltsyield.com & Trading Economics, 9 Jun 2026; Bank Rate 3.75% — BoE MPC Apr 2026; CPI 2.8%/RPI 3.0% — ONS Apr 2026; CAPE 39.8–41.7 — GuruFocus/multpl 8–9 Jun 2026; country CAPEs — Sibilis 31 Dec 2025 (stale, flagged); LS factsheets — Vanguard 30 Apr 2026 (UK weight gliding 25→20% by end-Jun 2026); annuities — HL/Retirement Line 1–7 Jun 2026; crypto — CoinGecko/Coinbase 9 Jun 2026; NS&I — nsandi.com 9 Jun 2026; expected returns — GMO 30 Apr 2026, Vanguard VEMO Dec 2025, JPM LTCMA Oct 2025. **Legislation:** gov.uk SPA timetable; Finance Act 2022 (NMPA 57); Commons Library SNo5847/SNo6546; 2026/27 allowances (£20k ISA, £60k AA, £3k CGT AEA, 18/24% CGT); full nSP £241.30/wk; RPI reform — UKSA/XPS, Feb 2030 confirmed; pensions-into-IHT — announced Oct 2024, due Apr 2027.

Prepared 9–10 June 2026 by Claude (acting as analytical IFA) for Chris & Abby Hadley. Companion working document: Docs/investment-plan-2026-06.md in the finance-tracker repository. All decisions remain yours; this document is analysis, not regulated financial advice.
